

# Batch B Group2

## Experiment 8(a)

Aditya Patkar [181070045]

Mohammed Mehdi [181070036]

Archeel Parekh [181070044]

**To display the number of visitors visiting the web page.**

### Overview :

To display the number of visitors visiting a web page using PHP.

### Goals

1. We need to keep a count of visitors there in the current session and increment it whenever a new user adds up.
2. Else don't change the count and display the current count present in the session.

### PHP Read File - fread()

**The fread() function reads from an open file.**

The first parameter of fread() contains the name of the file to read from and the second parameter

specifies the maximum number of bytes to read.

The following PHP code reads the "webdictionary.txt" file to the end:

```
fread($myfile,filesize("webdictionary.txt"));
```

## PHP Close File - fclose()

**The fclose() function is used to close an open file.**

It's a good programming practice to close all files after you have finished with them. You don't want an open file running around on your server taking up resources!

The fclose() requires the name of the file (or a variable that holds the filename) we want to close:

Example: `fclose($myfile);`

## PHP Check End-Of-File - feof()

**The feof() function checks if the "end-of-file" (EOF) has been reached.**

The feof() function is useful for looping through data of unknown length.

```
while(!feof($myfile)) {  
  
echo fgets($myfile) . "<br>";  
  
}
```

## PHP Code :

```
<?php
```

```
session_start();
```

```
if(isset($_SESSION['views']))
```

```
    $_SESSION['views'] = $_SESSION['views']+1;
```

```
else
```

```
    $_SESSION['views']=1;
```

```
echo"views = ".$_SESSION['views'];
```

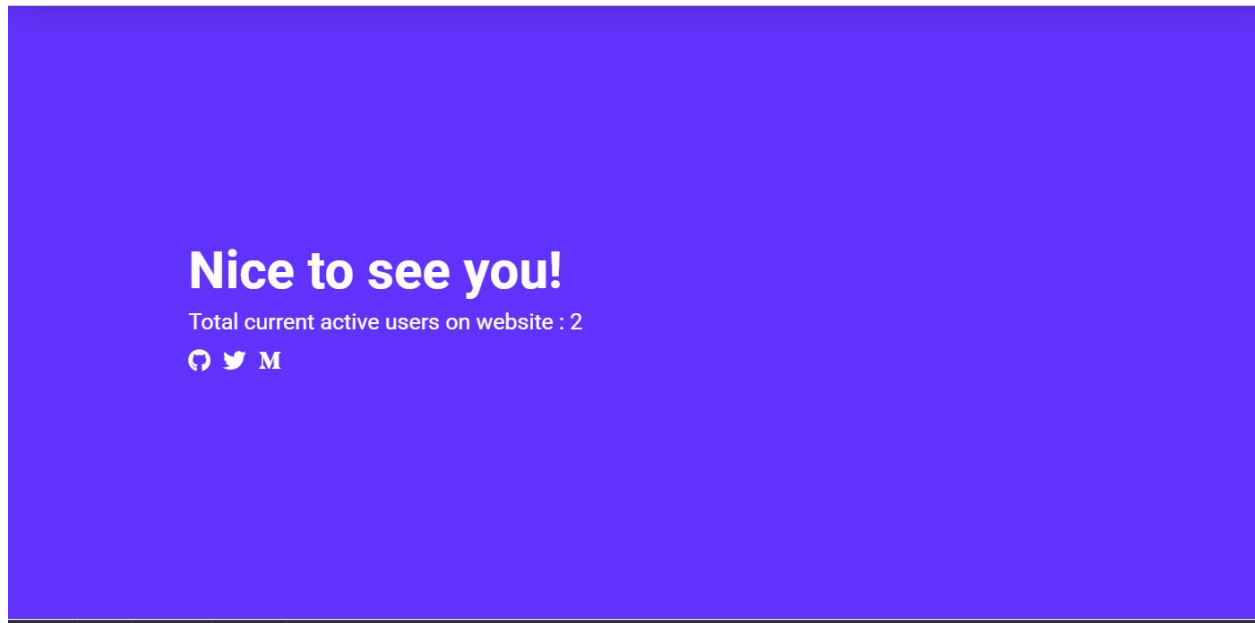

```
?>
```

## Conclusion :

Thus from this experiment I executed the php file handling operations to achieve the aim of displaying number of visitors on the website
